

The Air Matrix Advantage

D.H. Labs has always recognized the critical role the dielectric plays in the performance of audio cables. We pioneered the use of high performance dielectric materials, and we continue to lead the industry.

Although Teflon is widely regarded as the best available dielectric, it became apparent to us that a better approach was needed. This led to the development of the **air-teflon matrix** dielectric, which we simply call **Air Matrix**. The ultimate low-density dielectric, Air Matrix is actually 60% air!

The improved electrical characteristics of the **Air Matrix** dielectric result in open, clear and transparent sound, with unequalled soundstage and imaging properties. These improvements are most apparent with low level signals, making **Air Matrix** the ideal dielectric for interconnect cables. For this reason, our **Air Matrix** interconnect has become a favorite of demanding audiophiles, and also of recording studios for use on the world's finest microphones.
